

Challenges in integrating CS4RRA research findings into policy and practice

Akiça Bahri

Former Minister of Agriculture, Water Resources and Fisheries, Tunisia

**CLIMATE SERVICES FOR RISK REDUCTION IN WEST AFRICA (CS4RRA)
THE STOCKTAKING CONFERENCE**

Session 3: Perspectives and feedback to webinar outcomes from policy, science and investors

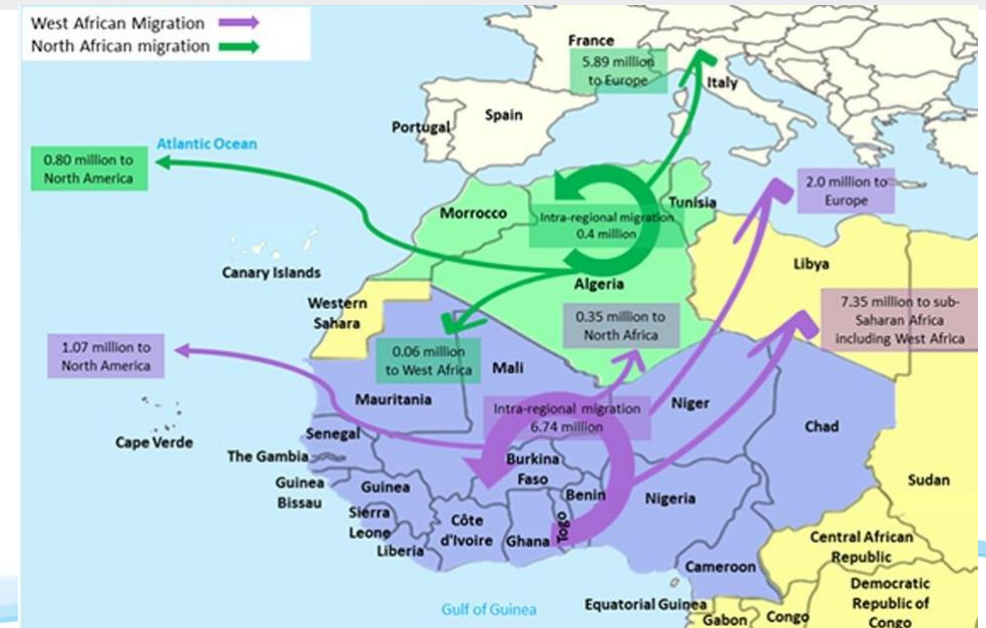

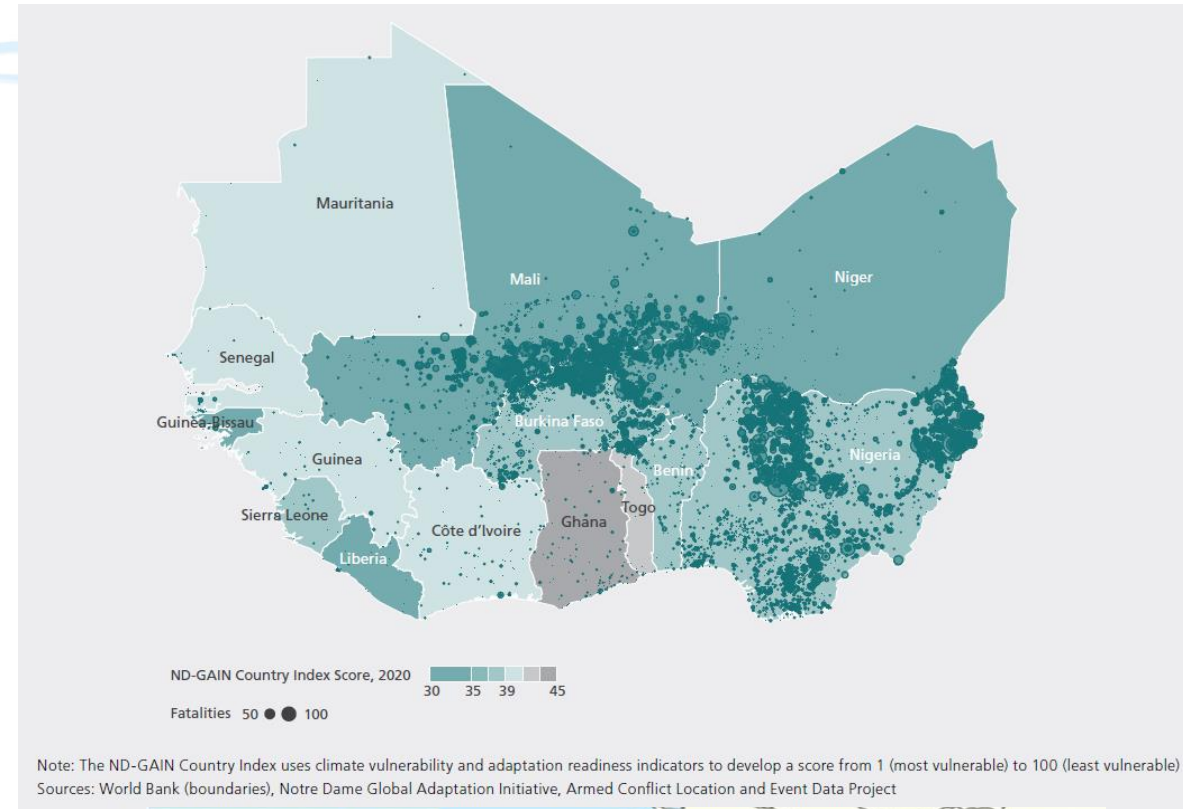

Banjul, The Gambia

5-6 November 2024

Introduction

1. “The world is plagued by a duo of dangerous crises: **climate and conflict**” (Zahidi, 2024)
2. The humanitarian and environmental catastrophe unfolding in Gaza and Ukraine puts **war, security and climate crisis on the agenda**
3. “**The conflicts are exacerbating the global climate emergency**, which goes far beyond the CO₂ emissions from bombs and planes” (after Lakhani, 2024)
4. “Armed conflict pushes humanity even closer to the precipice of climate catastrophe, and is an idiotic way to spend our shrinking carbon budget” (Boyd, 2024)
5. Atmospheric CO₂, responsible for heating the Earth, hit the highest-yet recorded levels in May 2024, followed by the hottest summer on record for 2,000 years

The climate and environmental impact of conflicts

Example of Gaza

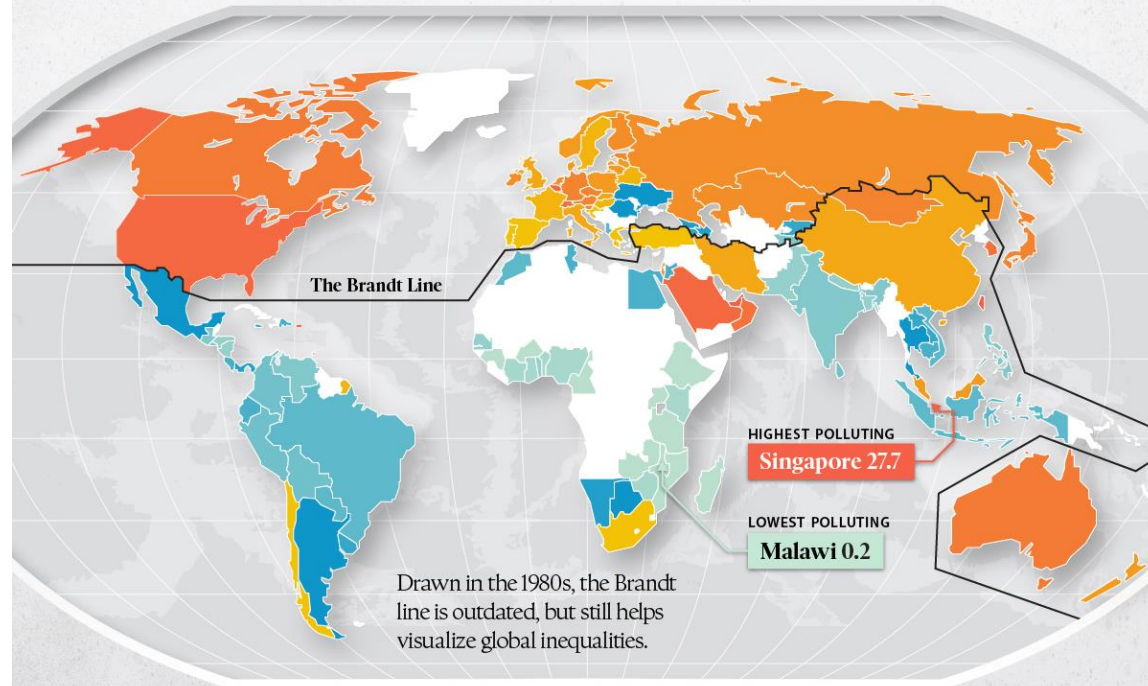

- 1. The carbon emissions from the war are staggering, with an average estimate of 536,410 tons of CO₂ in the first 120 days of the war**
- 2. This figure exceeds the annual C footprint of many climate-vulnerable nations (first 2 months of conflict produced more planet-warming gases than 20 climate-vulnerable nations do in a year)**
- 3. The air is contaminated with chemicals from weapons such as white phosphorus**
- 4. On average, in April 2024, Gazans had access to around 2 to 8 liters/person/day, compared to 85 liters/person/day before October 2023**
- 5. Nearly 60,000 cubic meters of untreated sewage flowing into the Mediterranean Sea daily**
- 6. 57% of Gaza's cropland has been damaged**
- 7. The C footprint of rebuilding Gaza will exceed the annual greenhouse gas emissions produced by 135 individual countries according to researchers in the UK and the US**

‘No climate justice without peace’

Countries That Pollute More or Less Than the Global Average

From consumption-based CO₂ emissions per capita

The Global North-South Divide

Economically developed countries contribute more to environmental degradation.

Developing countries contribute less to emissions but often face greater climate impacts.

Carbon Emissions PER-CAPITA BY COUNTRY

Measuring the total carbon emissions doesn't always paint the most accurate picture of a country's contribution, if their population isn't considered.

For example, even though China is the highest emitter of CO₂, the average American is responsible for producing **14.4** tonnes of CO₂ per person, compared to **7.1** tonnes for a Chinese citizen.

Here's a look at the biggest per-capita carbon emitters in the world:

Massive CO₂ emissions, primarily through gas flaring, have caused major oil-producing countries like **Bahrain, Oman, Kuwait, Qatar** and **U.A.E** to have high per-capita CO₂ emissions, despite their small population.

When accounting for the intensity of emissions, measured by emissions per GDP, **Mongolia** will have the highest per capita CO₂ emissions in 2030, followed by **Brunei** and **Malaysia**.

Unequal global distribution of wealth plays a factor in carbon emissions. Developed countries like **Qatar** emit **31t** CO₂/yr, while that of developing countries in **Africa** can be as low as **0.7t** CO₂/yr.

- *1 Middle East A
Bahrain, Oman, Kuwait, Qatar, United Arab Emirates
- *2 Middle East B
Israel, Jordan, Lebanon, Syria, Yemen
- *3 Asia A
Brunei, Malaysia, Mongolia, Singapore
- *4 Asia B
Asia without Asia A, China, India, Thailand, Taiwan, Indonesia, S. Korea or Japan
- *5 China
China, Hong Kong

The CO₂ emission values are based on estimates of the source chart. There may be a negligible difference between the ones provided here and the source data.

VISUALCAPITALIST.COM

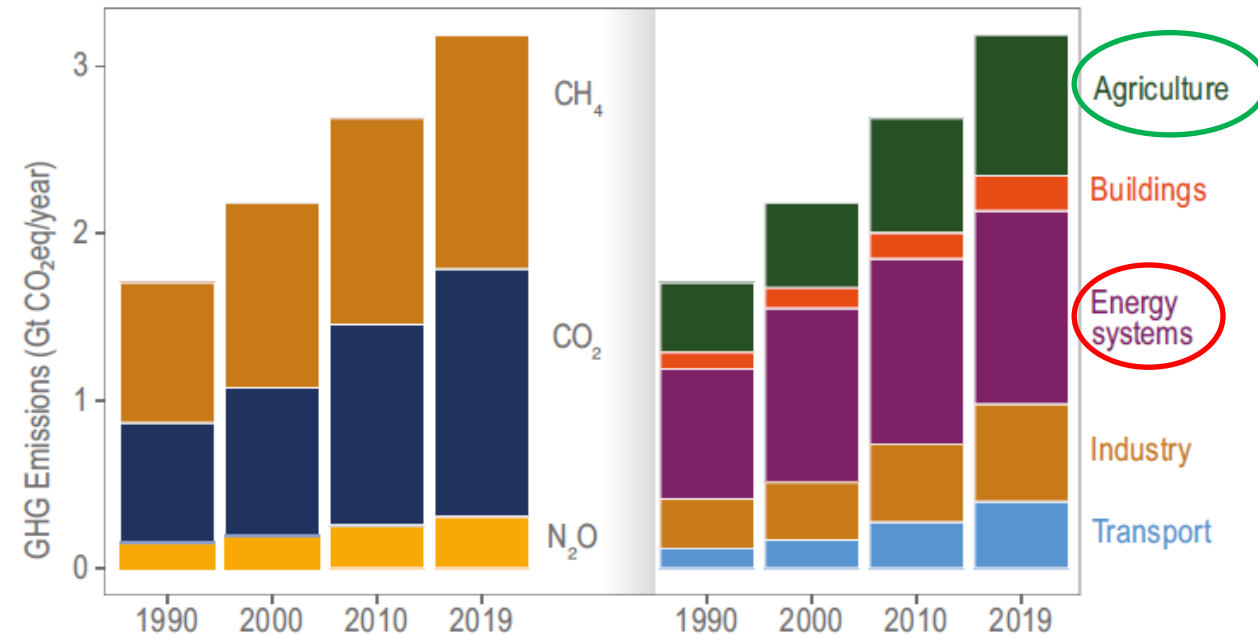

- Africa contributes less than 4% of the global green gas emissions
- Most vulnerable region in the world
- 7 of the 10 most vulnerable countries to climate shock in the world are in Africa

Historical greenhouse gas (GHG) emission trends for Africa

(c) Country GHG emissions (Africa)

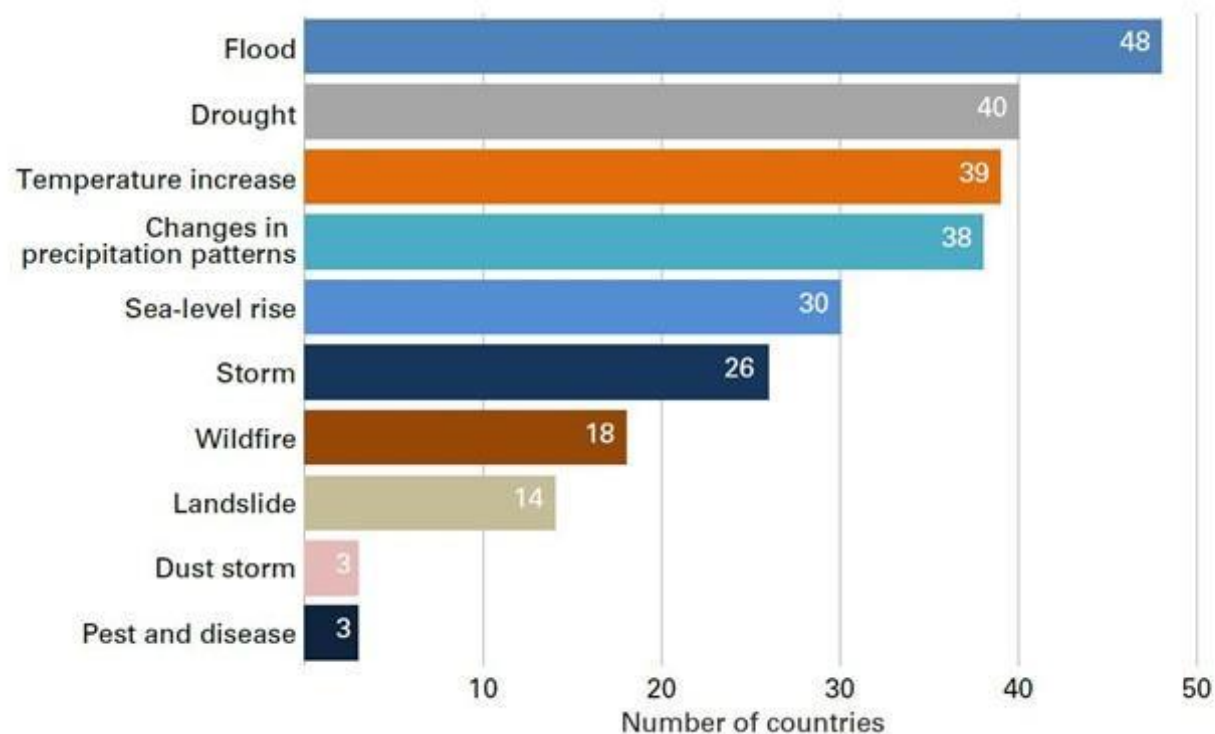

(d) Total GHG emissions by gas and sector (Africa)

Disproportionate burden from climate change and adaptation costs in Africa

(WMO State of the Climate in Africa 2023 report)

1. Between 1970 and 2021, Africa accounted for 35% of weather, climate, and water-related fatalities
2. **Only 40% of the African population has access to early warning systems** – lowest rate of the world
3. African countries are **losing 2–5% of GDP**
4. **Up to 9% of the budget** of many African countries redirected to **respond to climate extremes**
5. In SSA, cost of adaptation estimated to be between US\$ 30-50 billion annually over the next decade, or 2-3% of the region's GDP

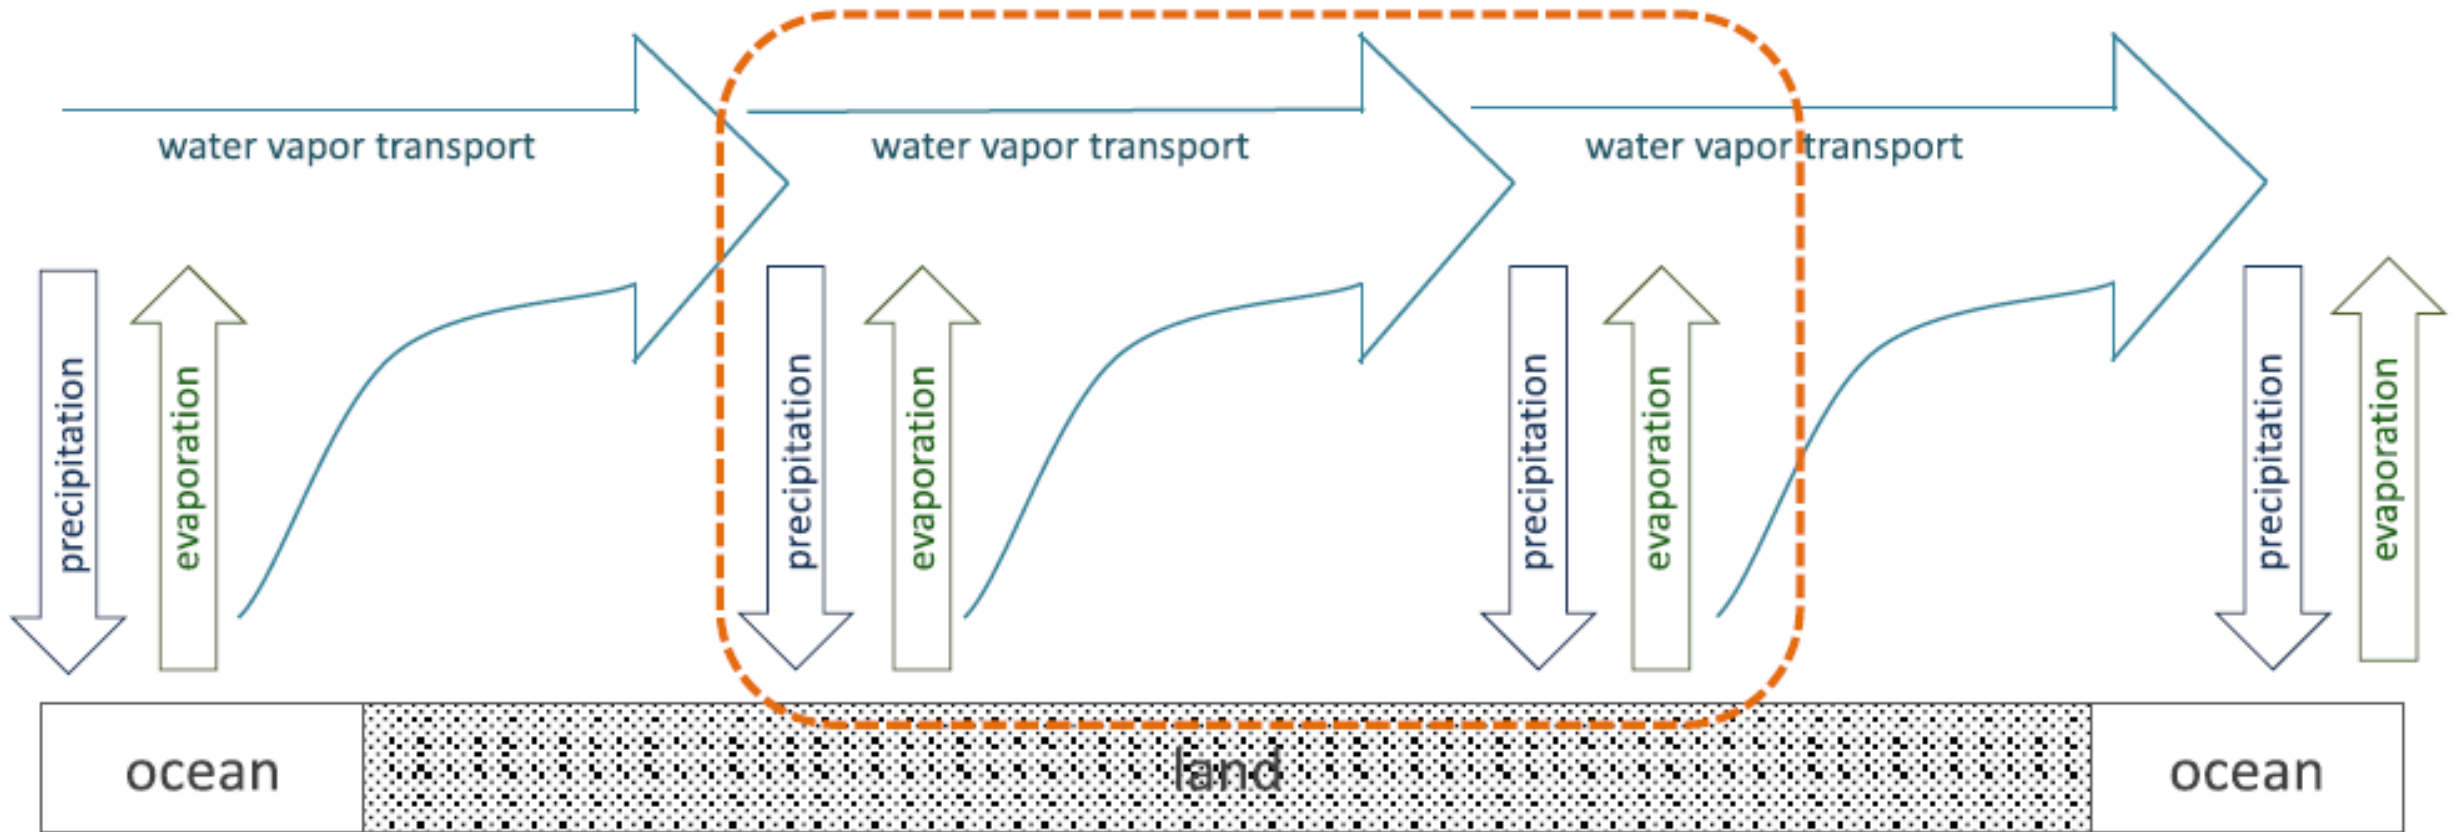

Hazards of greatest concern for the African region

Graph generated by WMO using the NDCs of 53 countries in Africa based on the active NDCs submitted as of June 2024

‘To tackle the climate crisis, we need accountability’

Understanding the planet's climate and ecosystems as a system allows for conceptual and practical division of water resources

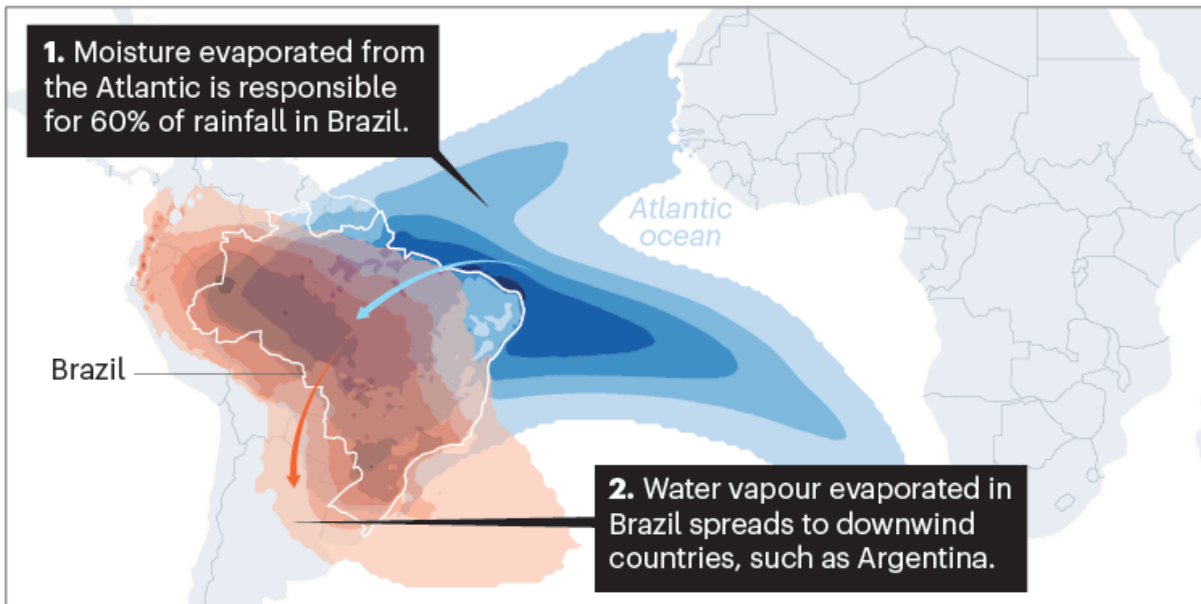

Distinguishing between green and blue water allows for conceptual and practical division of water resources between green water for landscape-scale agricultural and ecosystem initiatives, and blue water for municipal, industrial, and aquatic ecological demands”

ATMOSPHERIC WATERSHEDS

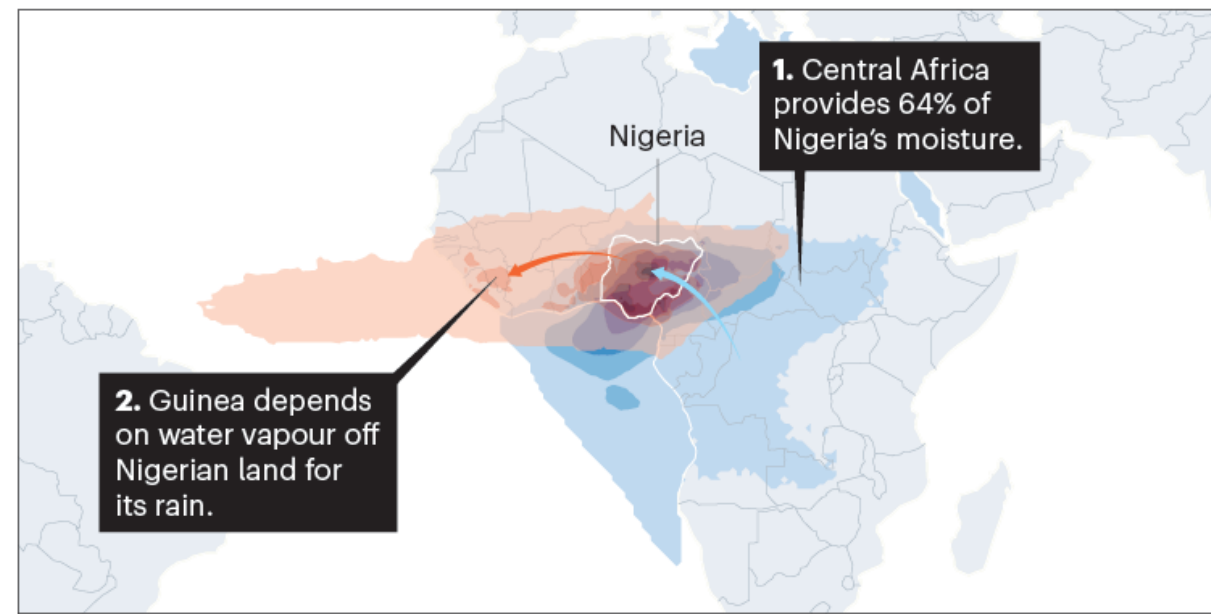

The atmosphere harbours precipitationsheds (regions that act as sources of precipitation to a certain area) and evaporationsheds (regions that receive this area's evaporation, which falls as precipitation). In addition to evaporation from the ocean, the water cycle is driven by moisture from evapotranspiration from terrestrial land and vegetation, and land-cover changes in one country can affect another's rainfall.

Ocean-driven

Land-driven

Synthesis of adaptation options for Africa

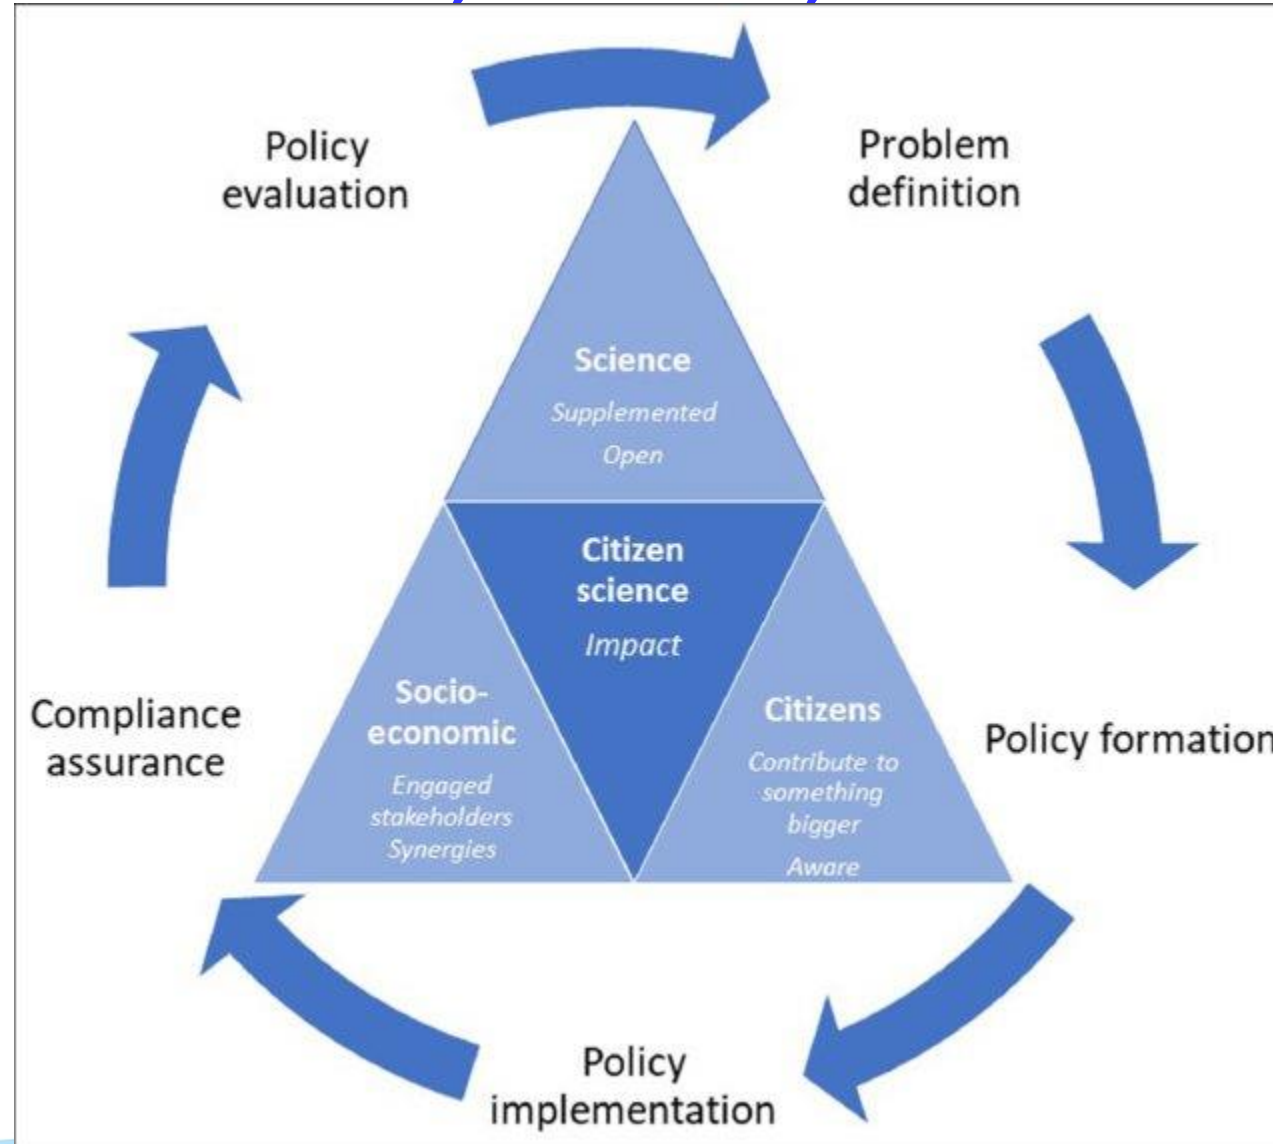

Science-Policy-Society Interfaces

The dialogue necessitates building partnerships and engaging a wide audience to be effective

The three key dimensions of citizen science: citizen scientist, scientific, socio-economic

Building blocks of policy coherence for sustainable development

Coherent policies across multiple ministries/sectors

Inform decision-making, and adjust policies in light of potential negative effects

Systematically **consider the effects of policies** on people's well-being "here and now", "elsewhere" and "later"

Engage all relevant actors to identify challenges, set priorities, align actions and mobilise resources

Align priorities and **promote coordinated action** at different levels of government

Mobilise whole-of-government action and orient policy development towards sustainable development

Support present needs and those of future generations in a balanced manner

Capitalise on synergies and address trade-offs between economic, social and environmental policy areas

Resolve divergences between policies, including between domestic and external policies

Conclusion

- Security and climate change threats in West Africa are complex and require **greater regional coordination and cooperation** to address the conflict issues and structures
- Addressing climate-related security threats and fostering collaboration can be achieved through **governance. Policy dialogues** on the shared management of natural resources, more inclusive natural resource governance, and improved integration of regional resource management techniques with pertinent national laws are all necessary to accomplish this
- It is necessary to **translate climate-related security threats into the language of local policies and link them to local goals**. Responses to conflicts should strengthen how people organize, govern, and adapt while addressing fundamental human security concerns and climatic vulnerabilities
- West African security and climate change are pressing issues that need **iterative solutions that combine learning and action**
- **Still significant knowledge gaps about the region's climatic vulnerabilities. Building capacity** in local research, identifying, connecting, and scaling up resilience-building and peacebuilding successes, and adjusting funding to match changing difficulties are all necessary to close these gaps
